

Demonstration

ClubSync: Rubric-Optimized Pitch Script (50/50)

Reverse-engineered from the MIT Project Expo Rubric Every line in this script is designed to score **Excellent** in all 9 criteria.

RUBRIC ↔ SCRIPT MAPPING

#	Criterion (Marks)	Where We Score It	Key Lines That Score
1	Problem Identification & Relevance (5M)	Speaker 1 — Slides 1, 2	App Fatigue, data silos, graduation knowledge loss
2	Innovation & Creativity (8M)	Speaker 2 — Slides 3, 5	DB triggers for auto-onboarding, State Machine for events, Append-only ledger
3	Technical Knowledge (8M)	Speaker 2 & 3 — Slides 4, 5, 6	RBAC, RLS, PostgreSQL triggers, JSONB, Realtime subscriptions
4	Implementation & Functionality (10M)	Speaker 3 — Slide 7 + Demo	Working dual-platform, real OAuth, real DB, live demo
5	Design & Engineering Approach (5M)	Speaker 2 — Slides 4, 5	FSM, Kanban Pipeline, Append-Only Ledger, Pub/Sub patterns
6	Results, Testing & Validation (5M)	Speaker 3 — Slide 7 + Demo	Live demo proof, real auth flow, real data
7	Practical Applicability & Impact (4M)	Speaker 1 & 3 — Slides 2, 8	Every college in India has clubs, scalable nationally
8	Presentation & Demonstration (3M)	All 3 — Flow + Demo	Shark Tank hook, smooth transitions, live demo

#	Criterion (Marks)	Where We Score It	Key Lines That Score
9	Teamwork & Individual Contribution (2M)	All 3 — Each speaker owns slides	Each member speaks with authority on their domain

15-MINUTE TIME PLAN

0:00 - 2:30 → Speaker 1: Hook + Problem (Slides 1, 2)
 2:30 - 6:30 → Speaker 2: Solution + Architecture + Modules (Slides 3, 4, 5)
 6:30 - 10:00 → Speaker 3: Tech + Results + Vision (Slides 6, 7, 8)
 10:00 - 12:30 → LIVE DEMO (Speaker 1 drives, others explain)
 12:30 - 15:00 → Q&A (All 3 answer based on their domain)

SPEAKER 1: The Hook & The Problem (Slides 1 & 2)

Time: 0:00 – 2:30 Rubric Targets: Problem Identification (5M) + Practical Applicability (4M)

(Slide 2 is on the screen FIRST — start directly with the problem)

Speaker 1:

"Good afternoon respected judges. Before we introduce ourselves, let me ask you a question.

How many of you have been part of a college club?

(Pause 2 seconds)

Now think about how that club was managed. Recruitment was done through Google Forms where half the responses got lost. Communication happened on WhatsApp where important messages were buried under memes. Member records were maintained on Excel sheets that only one person had access to. Event planning was scattered across Google Docs, and announcements were sent on email that nobody read.

(Gesture to the slide)

This is not just our college's problem. This is a **nationwide crisis**. There are over 45,000 colleges in India, and almost every single one manages their clubs using

this exact broken system.

The impact of this is devastating. First, there is **App Fatigue** — students are spending hours every week context-switching between 5 different apps just to manage club operations. The result? They cannot balance academics and extracurriculars. Second, there is **zero accountability** — no one knows who is responsible for what. Third, there is **permanent knowledge loss** — every year when the senior committee graduates, all the club's institutional data, contacts, and processes vanish completely. The next batch starts from scratch.

To solve this exact problem, we built ClubSync.

(Click to Slide 1: Cover Slide)

ClubSync is a centralized, multi-role digital platform that manages the complete lifecycle of college clubs — from recruitment and member management to event planning, task coordination, financial tracking, and real-time notifications. All under one roof.

I am [Your Name], and with me are [Name 2] who leads our system design, and [Name 3] who leads our technical implementation. I'll now hand it over to [Speaker 2] to walk you through our solution architecture."

SPEAKER 2: Solution, Architecture & Core Modules (Slides 3, 4, 5)

Time: 2:30 – 6:30 Rubric Targets: Innovation & Creativity (8M) + Technical Knowledge (8M) + Design & Engineering Approach (5M)

Speaker 2:

"Thank you [Speaker 1].

(Click to Slide 3: Proposed Solution)

ClubSync is not just another form builder or a to-do app. We have designed it as a **complete digital ecosystem** built on 7 integrated pillars: Club Management, Recruitment, Events, Members, Tasks, Finances, and Notifications. Each pillar is an independent module, but they all share a centralized PostgreSQL database — which means data flows seamlessly between them.

The key innovation here is that we are not just digitizing existing workflows. We are **automating** them. Let me show you how.

(Click to Slide 4: Roles & Architecture)

Every college club has a hierarchy. ClubSync respects that hierarchy through a strict **Role-Based Access Control** system — what we call RBAC. We have designed 6 distinct user roles: Owner, Faculty, President, Secretary, Executive, and Student. Each role sees a completely different dashboard with different permissions.

But here is what makes our RBAC truly innovative — we don't enforce these permissions in the frontend JavaScript, which can be easily bypassed. We enforce them at the **database level** using Supabase's **Row-Level Security policies**. This means even if someone reverse-engineers our API, the PostgreSQL database itself will reject unauthorized queries. This is the same security architecture used by enterprise SaaS companies.

(Click to Slide 5: Core Modules)

Now let me walk you through our three most innovative modules.

Module 1 — Smart Recruitment Pipeline. We replaced the traditional Google Forms approach with a **Kanban-based pipeline**. A President can drag candidate cards through stages: Applied, Screening, Interview, Selected, Onboarded. And here is our breakthrough innovation — when a candidate is moved to 'Onboarded', a **PostgreSQL database trigger automatically fires**. This trigger creates a membership record in the database and instantly grants that person dashboard access to the club. Zero manual data entry. Zero human error. This is **event-driven automation** at the database level.

Module 2 — Event Lifecycle State Machine. We modeled the entire event workflow as a **Finite State Machine** with strict state transitions. An Executive creates a Draft. The President submits it as a Proposal. Faculty must explicitly approve it before it goes Live. After the event date passes, it moves to Completed, and finally to Settled once finances are logged. No rogue events can bypass faculty approval. This is a proper engineering pattern — not just a checkbox.

Module 3 — Financial Ledger. We built an **append-only ledger** system — the same architecture pattern used in real banking systems. Transactions can never be edited or deleted. If there is a mistake, a reversing transaction must be logged.

This ensures a complete, tamper-proof audit trail. And write access to this ledger is restricted exclusively to the President role through RLS policies.

I'll now hand it over to [Speaker 3] to explain our technology stack and results."

SPEAKER 3: Tech Stack, Results & Vision (Slides 6, 7, 8)

Time: 6:30 – 10:00 Rubric Targets: Technical Knowledge (8M) + Implementation & Functionality (10M) + Results & Validation (5M)

Speaker 3:

"Thank you [Speaker 2].

(Click to Slide 6: Technology Stack)

Let me walk you through the engineering decisions behind ClubSync.

For the **frontend**, we chose React with Vite and TypeScript. React gives us a component-based architecture for reusable UI. Vite gives us extremely fast build times. And TypeScript gives us compile-time type safety — which means we catch bugs before they reach users, not after.

For **styling**, we use CSS Modules — which ensures each component's styles are scoped and cannot leak into other components. We also support both dark and light themes.

For the **backend**, we chose Supabase, which provides us four critical services in one platform: GoTrue for authentication supporting both Google OAuth and email/password login, a full PostgreSQL database with Row-Level Security, Blob Storage for club media and assets, and Realtime subscriptions for live data sync across all connected clients.

For the **mobile app**, we built a separate React Native application using Expo — giving students a native experience on both Android and iOS.

Our architecture follows a clear separation: the **mobile app** is optimized for students — browsing clubs, applying for recruitment, registering for events, and QR-based attendance scanning. The **web app** is optimized for management — Presidents managing recruitment pipelines, Executives managing task boards, and

Faculty approving events. Both platforms connect to the **same Supabase database** — a single source of truth.

(Click to Slide 7: Implementation Results)

What you are evaluating today is not a prototype or a Figma mockup. It is a **fully functional, deployed system**. Let me walk you through what we have actually implemented and tested.

We have implemented real authentication with Google OAuth and email/password, including email verification. We have a working RoleRouter component that automatically detects a user's role from the database and redirects them to the correct dashboard. We have implemented the President Dashboard with a Recruitment Kanban board, Team Directory, Financial Ledger, and Events Desk. The Secretary Dashboard includes a JSONB-based dynamic page editor where clubs can build their own profile pages. The Executive Dashboard includes a real-time Task Board with Supabase Realtime subscriptions, an Events module, and an Announcements system with targeted delivery.

We validated our system by testing the complete user journey: a student signs up, gets verified, applies to a club, gets moved through the recruitment pipeline, gets auto-onboarded via the database trigger, and immediately gains dashboard access. This end-to-end flow works without any manual intervention.

(Click to Slide 8: Future Scope)

Our vision goes far beyond a single college. ClubSync is architected to scale nationally. In Phase 2, we plan to integrate an AI-based club management assistant and advanced analytics dashboards. In Phase 3, we envision a national rollout where any college in India can onboard their clubs onto ClubSync in minutes.

(Step forward, direct eye contact with judges)

Judges, we started with a simple observation — that college clubs are the engine of student innovation, but they are being managed with broken, disconnected tools. We didn't just identify the problem. We engineered a production-grade, dual-platform, role-secured solution that actually works.

We are ClubSync. One Platform. Every Club. Perfectly Connected.

Thank you. We would now love to show you a live demonstration."

LIVE DEMO STRATEGY (10:00 – 12:30)

Rubric Targets: Implementation & Functionality (10M) + Results & Validation (5M) + Presentation & Demonstration (3M)

IMPORTANT

The demo is where you score or lose the biggest chunk — 10 marks for Implementation + 5 marks for Results. Do NOT just click around randomly. Follow this exact script.

Demo Flow (2.5 Minutes — Tight & Rehearsed)

Speaker 1 drives the laptop. Speaker 2 & 3 narrate.

Step 1: Login & Role Detection (30 seconds)

- Open ClubSync web app in browser.
- **Speaker 2 narrates:** "We are logging in with a President account. Notice the RoleRouter — it automatically detected the role from the database and redirected us to the President Dashboard."
- Show the President Dashboard briefly — the sidebar with Recruitment, Events, Ledger, Team.

Step 2: Recruitment Kanban (45 seconds) ★ THIS IS YOUR MONEY SHOT

- Click on Recruitment.
- **Speaker 2 narrates:** "Here is our Kanban recruitment pipeline. You can see candidates in different stages — Applied, Screening, Interview, Selected. Watch what happens when I drag this candidate to 'Onboarded'..."
- Drag a card to Onboarded column.
- **Speaker 2:** "The PostgreSQL trigger just fired. This person now has a membership record and can log in to see their own dashboard. Zero manual work."

Step 3: Event Lifecycle (30 seconds)

- Click on Events Desk.

- **Speaker 3 narrates:** "Here you can see events in different states — Draft, Proposed, Live. The President can submit a draft for Faculty Approval. No event goes live without explicit faculty sign-off."

Step 4: Financial Ledger (20 seconds)

- Click on Ledger.
- **Speaker 3 narrates:** "This is our append-only financial ledger. Every transaction is permanently recorded. The balance is computed dynamically. Only the President role can write to this table — enforced by Row-Level Security."

Step 5: Switch to a Different Role (25 seconds)

- Open a new tab or incognito window.
- Log in as an Executive account.
- **Speaker 1 narrates:** "Notice — same app, same URL, but because this user is an Executive, the RoleRouter gives them a completely different dashboard. They see the Task Board and Announcements — not the Ledger or Recruitment."

Speaker 1: "And that concludes our demonstration. We are ready for your questions."

Q&A BATTLE PREP (12:30 – 15:00)

Rubric Targets: Technical Knowledge (8M) + Teamwork (2M)

TIP

Rule for Teamwork marks: When a judge asks a question, the person whose domain it falls under should answer. Don't let one person answer everything. This shows "Excellent coordination" and "all members demonstrate strong contribution."

Likely Questions & Killer Answers:

Q: "How is this different from using Notion or Slack?" Answer (Speaker 2): "Notion and Slack are generic productivity tools. They have no concept of club hierarchies, recruitment pipelines, or event approval workflows. ClubSync is

purpose-built for the college club ecosystem. Our database triggers automate onboarding, our state machine enforces faculty approvals, and our RLS policies enforce role-based security at the database level. You cannot configure Notion to do any of that."

Q: "What if a college already uses Google Workspace?" Answer (Speaker

1): "That's exactly the problem we solve. Google Workspace is a collection of disconnected tools. A club using Google Forms for recruitment, Google Sheets for members, and Gmail for announcements has data scattered across 4 platforms with no integration. ClubSync unifies all of that into one platform with a single database."

Q: "How scalable is this? Can it handle 100 clubs?" Answer (Speaker

3): "Absolutely. Our backend is Supabase which runs on PostgreSQL — the same database technology used by companies like Instagram and Spotify. Our Row-Level Security policies automatically filter data per club, so adding more clubs doesn't increase complexity. The architecture is horizontally scalable."

Q: "What about data privacy and security?" Answer (Speaker 3): "Security is our top priority. We use Supabase GoTrue for authentication with JWT tokens. All data access is controlled by Row-Level Security policies enforced at the PostgreSQL level — not in frontend code. This means even API-level attacks cannot bypass our access controls. Financial data is only writable by Presidents, and all transactions are append-only."

Q: "Have you tested this with real users?" Answer (Speaker 1): "We have tested the complete end-to-end user journey — sign up, email verification, club application, recruitment pipeline progression, auto-onboarding via database trigger, and role-based dashboard access. Every flow works without manual intervention. Our next step is piloting with actual clubs at our institute."

Q: "What is your unique selling point in one line?" Answer (Speaker 1): "We are the only platform that uses database-level automation and enterprise-grade security to manage the complete lifecycle of a college club — from recruitment to graduation."

FINAL CHECKLIST BEFORE THE PRESENTATION

- Laptop fully charged + charger with you

- Web app deployed and accessible (test the URL)
- Two browser profiles ready (President account + Executive account)
- Internet backup (mobile hotspot if Wi-Fi fails)
- Practice the demo 3 times — it should be muscle memory
- Each speaker practices their section at least 5 times alone
- Time yourselves — Speaker 1: 2.5 min, Speaker 2: 4 min, Speaker 3: 3.5 min
- Keep water on stage
- Dress sharply — first impressions matter for the Presentation (3M) criterion
