

Project Overview

The user is developing a college-focused application aimed at connecting 75+ clubs into a unified platform. The goal is to centralize events, communication, and student engagement.

Core Idea

An application where all college clubs are integrated, allowing students to explore events, register, receive updates, and interact efficiently.

Features Discussed

- Dashboard for clubs and events - Event registration system - Notifications & reminders - Hackathon schedules - Student engagement features

Technical Exploration

The user explored backend options including Firebase, MongoDB, and SQL. Firebase was considered for real-time capabilities and scalability up to tens of thousands of users.

Branding & Naming

Names such as ClubSync, DotHub, and Eventify were explored. Focus was on uniqueness, memorability, and strong identity.

UI/UX Planning

User emphasized meaningful dashboard design where each button has a clear purpose. Mobile-first UI approach considered.

Learning Progress

- Started learning Git & GitHub - Explored databases and scalability - Practiced coding problems - Worked on communication and idea presentation

Next Steps

- Finalize app name - Design complete UI - Build backend (Firebase or alternative) - Implement core features - Test with real users
